

Xenex's Superbug Zapping "Robot" Eliminates CRE; Being Used to Fight HAI and Enhance Patient Safety

The Xenex "robot" uses pulse xenon to deliver UV light throughout patient rooms, operating rooms (ORs), equipment rooms, emergency rooms, intensive care units (ICUs) and public areas to destroy viruses, bacteria and bacterial spores in just 5-10 minutes per room. (Photo: Business Wire)

Customers Report that Xenex Device Halts Spread of Norovirus Among Staff & Patients

As major news outlets including The Wall Street Journal, USA Today and CBS News have recently reported, U.S. hospitals are engaged in a ferocious battle against the deadly pathogens and multi drug-resistant organisms (MDROs) which cause healthcare associated infections (HAIs).

Hospital cleanliness plays a role in the spread of HAIs, which are caused by microorganisms such as *Clostridium difficile* (C. diff), MRSA, Carbapenem-Resistant Enterobacteriaceae (CRE) and *Acinetobacter baumannii*. Hospital cleaning teams are not able to disinfect all the surfaces in patient rooms in the allotted time, with research showing that more than half of the surfaces remain untouched. Some superbugs such as C. diff are showing resistance to disinfectants, making them even more difficult to eliminate. Others, like CRE, have developed a resistance to antibiotics, making them nearly impossible to treat.

HAIs are responsible for approximately 100,000 deaths in the U.S. each year – and many patients aren't aware that they may contract an infection as a result of their hospital stay. Innovative hospitals throughout the U.S. including MD Anderson Cancer Center, WellStar Health System, St. Joseph's Hospital Health Center and Cooley Dickinson Hospital are utilizing a portable room disinfection system from Xenex Healthcare Services to make their patients safer.

The Xenex "robot" uses pulse xenon to deliver ultraviolet (UV) light throughout patient rooms, operating rooms (ORs), equipment rooms, emergency rooms, intensive care units (ICUs) and public areas to destroy viruses, bacteria and bacterial spores in just 5-10 minutes per room. Uniquely designed for ease of use and portability, a hospital's environmental services staff can operate the Xenex device without disrupting hospital operations or requiring the use of expensive chemicals. A Xenex device can disinfect over 30 rooms per day, so hospitals use them continuously to reduce contamination levels throughout their facilities.

"The most important step in infection control begins with a clean environment and that's what Xenex's room disinfection system accomplishes. In just 5-10 minutes per room, our device can eliminate the deadly microorganisms and superbugs that cause infections. We have proven repeatedly that the science of our pulsed xenon light makes it incredibly effective against the most challenging bacteria, viruses and even C. diff spores," said Dr. Mark Stibich, Chief Scientific Officer of Xenex. "Every week we hear reports from our customers that they are experiencing fewer patient infections as a result of using our device, which is extremely gratifying. We are in a war against deadly superbugs – and Xenex is a proven weapon in this battle."

Xenex systems have proven to be effective against a variety of the most dangerous superbugs and studies show the Xenex room disinfection system is consistently 20 times more effective than standard chemical cleaning practices. A recent study performed at MD Anderson Cancer Center demonstrated that the Xenex system was more effective than bleach in reducing C. diff in patient rooms.

"The Xenex robots have enabled Cooley Dickinson Hospital to not only lower our infection rates, they have been responsible for saving lives," said Dr. Joanne Levin, medical director of the Cooley Dickinson Hospital Infection Prevention Program. "In 2012, we were able to reduce C. diff infections by 53 percent, which is huge."

And while Xenex is focused on eliminating deadly pathogens which are resistant to traditional cleaning chemicals and antibiotics, some customers are crediting their Xenex system for a reduction in the spread of flu and norovirus in their facilities. A customer recently used its Xenex system to halt a norovirus outbreak, which was brought into the hospital by a visitor. According to the hospital, several patients and staff members on the floor visited by the infected person quickly developed symptoms. The hospital used the Xenex system to disinfect the rooms, computers and medical equipment where the outbreak occurred.

"With our proven ability to stop norovirus in its tracks, we are excited by the possibility to stop the spread of these viruses that adversely affect hospitals, cruise ships and hotels. By halting the spread of the virus we are helping facilities prevent these episodes, which is a big step forward in infection control," said Morris Miller, CEO of Xenex.

Xenex devices are made in the U.S. and friendlier to the environment than cleaning chemicals or UV devices using toxic mercury. Xenex is the only company to offer a xenon-based room disinfection product that is patented, tested, and proven to deliver a germicidal dose of UV-C light capable of killing C. diff in five minutes or less.
